

React Course API Lab - Short Answers

Why use `useEffect` here?

`useEffect` sends the GET request when the Courses component is loaded. It prevents the request from running again on every render.

What does `setCourses` do?

`setCourses` stores the course data returned by the API in React state. React then re-renders the component and displays the courses in the table.

Why can Postman work while a browser request fails?

Postman does not enforce CORS rules. Browsers do enforce CORS, so a browser request fails when the backend does not allow the frontend origin through the `Access-Control-Allow-Origin` header.
